

```
1  'use strict';
2  prompt("Enter a number:" );
3  // Lecture 39: Introduction to Arrays
4  const friend1 = 'Michael';
5  const friend2 = 'Steven';
6  const friend3 = 'Peter';
7
8  // Initialising an array (literal syntax)
9  const friends = ['Michael', 'Steven',
10 •   'Peter'];
11 // Note that the variable name does not
12 •   require
13 // the [] notation.
14 console.log(friends);
15 // Another way of initialising an array
16 // Remember to use the 'new' keyword
17 const y = new Array(1991, 1984, 2008,
18 •   2020);
19 // An array can hold any number of values
20 •   that we want, and also values of any
21 •   type that we like.
22 // Arrays in JS are zero-based.
23 console.log(friends[0]); // ==> Michael
24 console.log(friends[2]); // ==> Peter
25 // Obtain the number of elements in the
26 •   array
27 // Access the length as a PROPERTY (OOP)
28 console.log(friends.length);
29 // Obtain the last element in the array
30 // The length of array is NOT 0-based.
31 console.log(friends[friends.length - 1]);
32 // Modifying an element
```

```

27 friends[2] = 'Jay';
28 console.log(friends); // ==> ['Michael',
  • 'Steven', 'Jay']
29 // NOTE: the array is declared with
  • CONST, and it turns out that only
  • primitive values are immutable. An
  • array is NOT a primitive value, and so
  • we can ALWAYS change it and mutate it.
  • It works this way because of the way
  • that JS stores things in memory. More
  • on Memory Allocation and management in
  • the future.
30
31 // BUT what we cannot do is
32 friends = ['Bob', 'Alice']; // ERROR
  • CODE – reassignment to constant
  • variable.
33
34 // Arrays can actually hold values with
  • DIFFERENT PRIMITIVE TYPES
35 // You can even put an array inside an
  • array.
36 const firstName = 'Jonas';
37 const jonas = [firstName, 'Schmedtmann',
  • 2037 - 1991, 'teacher', friends];
38 console.log(jonas); // prints the array
39 console.log(jonas.length); // ==> 5
40 console.log(jonas[jonas.length - 1][0])//
  • ==> Michael
41
42 // Exercise
43 const calcAge = function (birthYear) {

```

```

43   const calcAge = function (birthYear) {
44     return 2037 - birthYear; // operation
    •   here expects a single value
45   }
46   const years = [1990, 1967, 2002, 2010,
    •   2018];
47   // note that in this case the function
    •   calcAge is expecting an integer, not an
    •   array
48   console.log(years); // ==>NaN
49   // So you have to do this instead.
50   const age1 = calcAge(years[0]);
51   const age2 = calcAge(years[1]);
52   const age3 = calcAge(years[years.length -
    •   1]);
53   console.log(age1, age2, age3);
54
55   const ages = [calcAge(years[0]),
    •   calcAge(years[1]),
    •   calcAge(years[years.length - 1])];
56   console.log(ages);
57
58   // Hmm looks like this is inefficient:
    •   KIV – loops
59   ////////////////////////////////////////////
    •   //////////
60   // Lecture 40: Basic Array Operations
    •   (Methods)
61   const friends = ['Michael', 'Steven',
    •   'Peter'];
62   // Arrays in JS are dynamic, you are able
    •   to add elements to arrays.

```

```
63 // 1. Insertion
64
65 // A) Append to end of array
66 const newLength = friends.push('Jay'); //
  • note that even if its a const, you can
  • change its length attribute!
67 console.log(friends); // ==> [ ...,
  • 'Peter', 'Jay']
68 // This push function returns a value,
  • and it is the length of the new array.
69 console.log(newLength); // ==> 4
70 // B) Add element to beginning of the
  • array
71 const length = friends.unshift('John');
72 console.log(friends); // ==> ['John',
  • 'Michael', ...]
73 // The unshift methods also returns a
  • value – that is the length of the new
  • array.
74 console.log(length); // ==> 5
75
76 // 2. Remove elements
77 // A) Remove from end of array
78 friends.pop(); // Last
79 const popped = friends.pop();
80 // friends.pop() returns the removed
  • element.
81 console.log(popped); // ==> Peter
82 console.log(friends); // ==> [John, ... ,
  • Steven]
83
84 // B) Remove the first element in the
```

- array

```

85 friends.shift();
86 console.log(friends);
87
88 // 3. Find the index of an element (O(n)
  • time?)
89 console.log(friends.indexOf('Steven')); /
  • / ==> 1
90 console.log(friends.indexOf('Bob')); //
  • ==> -1 (flag for an element not in a
  • array)
91
92 friends.push(23);
93 // 4. If the array contains an element
94 // ES6 // This will return true or false
95 console.log(friends.includes('Steven')); /
  • / ==> true
96 console.log(friends.includes('Bob')); //
  • ==> false
97 console.log(friends.includes(23)); // ==>
  • true
98 // This is actually using strict equality
  • - (no type coercion)
99 console.log(friends.includes(`23`)); //
  • ==> false
100
101 // Using .includes() to write Conditions
102 if (friends.includes('Steven')) {
103     console.log('You have a friend called
      • Steven');
104 }
105

```
